

Chapter 3 Proteins

Outline

- ◆ **Classification of proteins**
- ◆ **The basic building blocks of proteins—Amino acids**
- ◆ **Structure of proteins**
- ◆ **Structure and function relationships of proteins**
- ◆ **Properties of proteins**
- ◆ **Separation, purification and determination of proteins**

What are proteins?

Proteins are macromolecules composed of **amino acids** linked together through **peptide bonds**, which have a stable conformation and a certain biological function.

Proteins are linear **polymers** 聚合物 built of **monomer** 单体 units called amino acids.

Section 1

Classification of proteins

1. Chemical Components of Proteins

- ◆ **Major** elements: C, H, O, N, S
- ◆ **Trace** elements: P, Fe, Cu, Zn, Mo, I, ...
- ◆ The average **nitrogen** content in proteins is about 16%, and proteins are the major source of N in biological systems.

Section 1

Classification of proteins

1. Chemical Components of Proteins

- ◆ The protein quantity can be estimated---**Kjeldahl determination** (凱氏定氮法)
- ◆ protein in 100g sample = N per gram \times **6.25** \times 100

2. Protein Classification

◆ Classification based on **the overall shape**

Globular protein（球状蛋白质）：

globular or ellipsoidal (long/short <10), **soluble** in water; including enzymes, transportors, receptors, regulators, ...

Fibrous protein（纤维状蛋白质）：

highly elongated; **insoluble** in water; including collagen（胶原蛋白），elastin（弹性蛋白）， α -keratin（ α -角蛋白），...

◆ Classification based on **chemical compositions**

Simple protein（简单蛋白质）：

made up of amino acids completely, without non-protein components

Conjugated protein（缀合蛋白质）：

conjugated protein = **apoprotein** + prosthetic groups

Prosthetic group（辅基） is non-protein part, binding to protein by **covalent bond**. This group can be carbohydrates, lipids, nucleic acids, phosphates, pigments（色素）， or metal ions.

Category of conjugated proteins

| Category (类别) | Prosthetic group (辅基) | Example (举例) |
|---------------------------------|-----------------------|--|
| Nucleoprotein (核蛋白) | nucleic acids | Chromosome, ribosome |
| Glycoprotein (糖蛋白) | carbohydrates | Immunoglobulin (Ig) |
| Lipoprotein (脂蛋白) | lipids | High-density lipoprotein |
| Phosphoprotein (磷蛋白) | phosphates | Casein (酪蛋白) |
| Chromoprotein (色蛋白) | pigments | Hemoglobin (血红蛋白Hb) |
| Metalloprotein (金属蛋白) | metal ions | Ferritin (铁蛋白), calmodulin (钙调蛋白) |

◆ Classification based on **biological functions**

👍 **Enzymes – Ribonuclease (核糖核酸酶)**

👍 **Regulatory proteins – Insulin and growth hormone**

👍 **Storage proteins – ovalbumin (卵清蛋白)**

👍 **Defensive and protective proteins – Antibody, toxin (毒素)**

👍 **Transport protein – Hemoglobin**

👍 **Structural proteins – α -keratin, Collagen**

👍 **Contractile proteins – Actin (肌动蛋白), Myosin (肌球蛋白)**

Section 2

Protein architecture — Amino acids

1. General structure of common amino acid (AA)

- ◆ The basic building blocks of proteins
- ◆ About 300 types of AAs in nature, but **only 20 types** are used for protein synthesis in biological systems.
- ◆ A typical α -amino acid has an **amino group**, a **carboxyl group**, a hydrogen atom and a **side-chain (R group)** attached to **the same carbon atom (C_α)**

Different side-chain (R group)
Different chemical and physical properties

- ◆ Except for **proline**, all 19 of the common AAs are α -amino acids; Proline is an α -imino acids.
- ◆ The α -carbon atom is always **asymmetric or chiral center** except in **glycine**, hence, all amino acids are **optical activity**(旋光性) and have **two stereoisomers (mirror-image forms)** (D or L configuration).

- ◆ The two stereoisomers of each AA are designated by **D, L system** according to the D- and L-glyceraldehyde

L-Glyceraldehyde

D-Glyceraldehyde

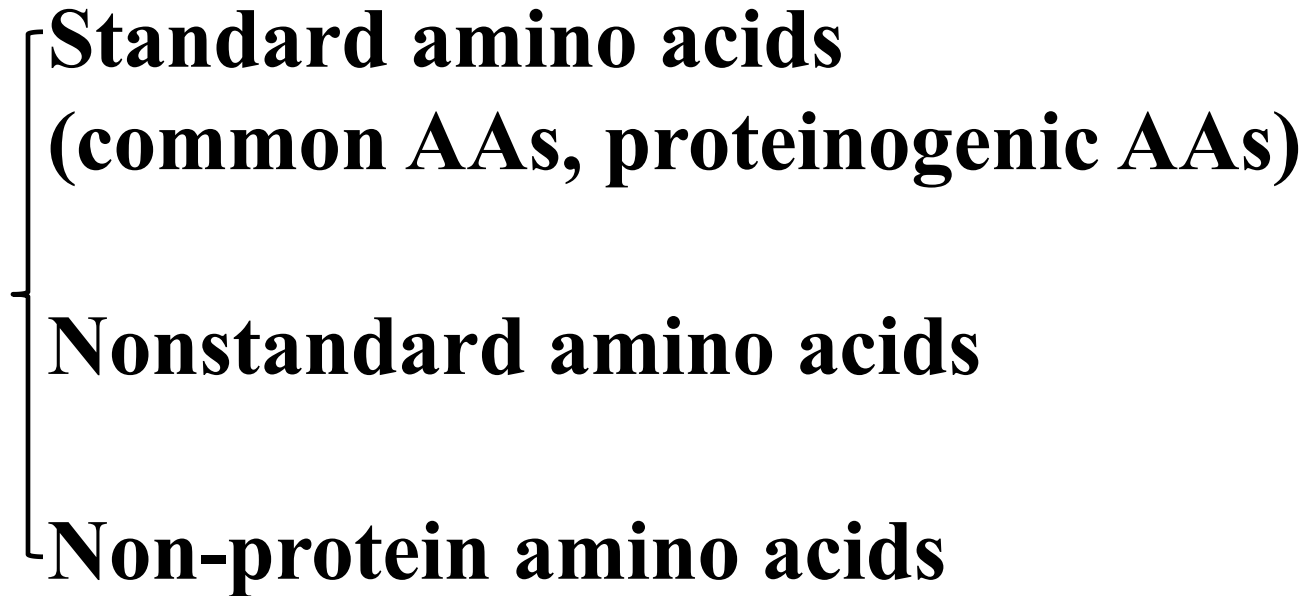

L-Alanine

D-Alanine

- ◆ Only the **L-AAAs** have been found in proteins
- ◆ **D-isomers** have been found only in small peptides of bacteria cell walls or in some peptide antibiotics
- ◆ **Racemate**(外消旋物): An equimolar mixture of the **D-** and **L-isomers** of an optically active compound.
- ◆ A racemic mixture shows no optical activity.

2. Amino acid classification

Standard amino acids

- ◆ **Commonly found in proteins**
- ◆ **Encoded by genetic codes and directly introduced into protein during translation**
- ◆ **Differ in side chain (R group)**
- ◆ **20 commonly found**
- ◆ **2 rarely found (selenocysteine and pyrrolysine)**
(硒代半胱氨酸, Sec, U) (吡咯赖氨酸, Pyl, O)

Classification of the standard amino acids

By chemical structure of R groups

- Aliphatic amino acids: 15**
- Aromatic amino acids: 3**
- Heterocyclic amino acids: 3**

By acid-base properties

- Neutral amino acids: 15**
- Acidic amino acids: 2**
- Basic amino acids: 3**

By the polarity of R groups

- Non-polar amino acids: 9**
- Polar amino acids: 11**

Non-polar R groups amino acids

(1) Alanine (Ala, A)

(2) Valine (Val, V)

(3) Leucine (Leu, L)

(5) Proline (Pro, P)

(4) Isoleucine (Ile, I)

(6) Phenylalanine (Phe, F)

(7) Tryptophan (Trp, W)

(8) Methionine (蛋氨酸, Met, M)

(9) Glycine (Gly, G)

Polar, uncharged R groups amino acids

(10) Serine (Ser, S)

(11) Threonine (Thr, T)

(12) Cysteine (Cys, C)

(13) Tyrosine (Tyr, Y)

(14) Asparagine (Asn, N)

(15) Glutamine (Gln, Q)

Polar, negatively charged R groups amino acids

(16) Aspartic acid (Asp, D)

(17) Glutamic acid (Glu, E)

Polar, positively charged R groups amino acids

(18) Lysine (Lys, K)

(19) Arginine (Arg, R)

(20) Histidine (His, H)

According to whether it can be synthesized { Essential amino acids
Nonessential amino acids

◆ Essential amino acids (or indispensable AAs)

- **Cannot be synthesized** by the humans, **must be supplied in the diet**
- **8: Val, Ile, Leu, Phe, Met, Trp, Thr, Lys**

◆ Semi-essential amino acids

- **2: His and Arg**
- **Required by infants and growing children**

Essential and Nonessential Amino Acids in Humans

| Essential | Nonessential |
|----------------------|----------------------|
| Arginine* | Alanine |
| Histidine* | Asparagine |
| Isoleucine | Aspartic acid |
| Leucine | Cysteine |
| Lysine | Glutamic acid |
| Methionine | Glutamine |
| Phenylalanine | Glycine |
| Threonine | Proline |
| Tryptophan | Serine |
| Valine | Tyrosine |

***Arginine and histidine are essential in the diets of juveniles, not adults.**

21st & 22nd AAs

Selenocysteine
(Sec, U)

Pyrrolysine
(Pyl, O)

Nonstandard amino acids

- ◆ Occur only rarely in proteins
- ◆ Amino acid derivatives found in proteins
- ◆ formed by **post-translational modification**
- γ -Carboxyglutamate (carboxylation of glutamate) found in the blood-clotting protein prothrombin, allows for better binding of calcium cations.
- collagen contain 4-hydroxyproline and 5-hydroxylysine, generated by hydroxylation of proline and lysine respectively.

Non-protein amino acids

- ◆ Present in living organisms, but **Not** found in proteins
- ◆ some are β -AA, γ -AA, or D-AA, etc
- ◆ Never directly introduced into proteins during translation
- ◆ Can be naturally-occurring or chemical modifications of standard AAs

β-Alanine

β-aminobutyric acid

Homoserine

Homocysteine

Ornithine

Citrulline

Orn and Cit:
Intermediates in
AA metabolism

3. Acid-base properties of Amino acids and pI

- ◆ Amino acids has both **a basic amine group** and **an acidic carboxylic acid group**
- ◆ In neutral solution (pH7.0), the amino acid contains a **negative charge** and a **positive charge**. It is called a **zwitterions**(兼性离子) or **dipolar ions** (偶极离子).

Nonionic form

Zwitterionic form

◆ Substances having this dual (acid-base) nature are **amphoteric** 两性的 and are often called **ampholytes** (两性电解质)

◆ Amino acid zwitterions are **amphoteric**. They can react as either acids or bases.

Zwitterion

as acid

Zwitterion

as base

◆ AAs are all weak polyprotic acids 多元弱酸

◆ Amino acids have characteristic titration curves
(特定的滴定曲线)

- ◆ AAs ionize to various states depending on **pH values**
- ◆ **Isoelectric Point** (**pI**, 等电点) is the characteristic pH at which an amino acid has equal positive and negative charge (the net electric charge is zero)
- ◆ AAs in solution at pI are predominantly in **dipolar form**
- ◆ pI is determined by **pK** (K: dissociation constant of the ionizable groups)

pH < pI

pH = pI

pH > pI

cation

Zwitterion

anion

Move toward the negative electrode

Do not move

Move toward the positive electrode

- At any pH below its pI, AA has a **net positive charge** and will move toward the negative electrode (the cathode).
- At any pH above its pI, AA has a **net negative charge** and will move toward the positive electrode (the anode).
- The farther the pH of a AA solution is from its pI, the greater the net electric charge of the population of AA molecules.

Calculation of Isoelectric Point

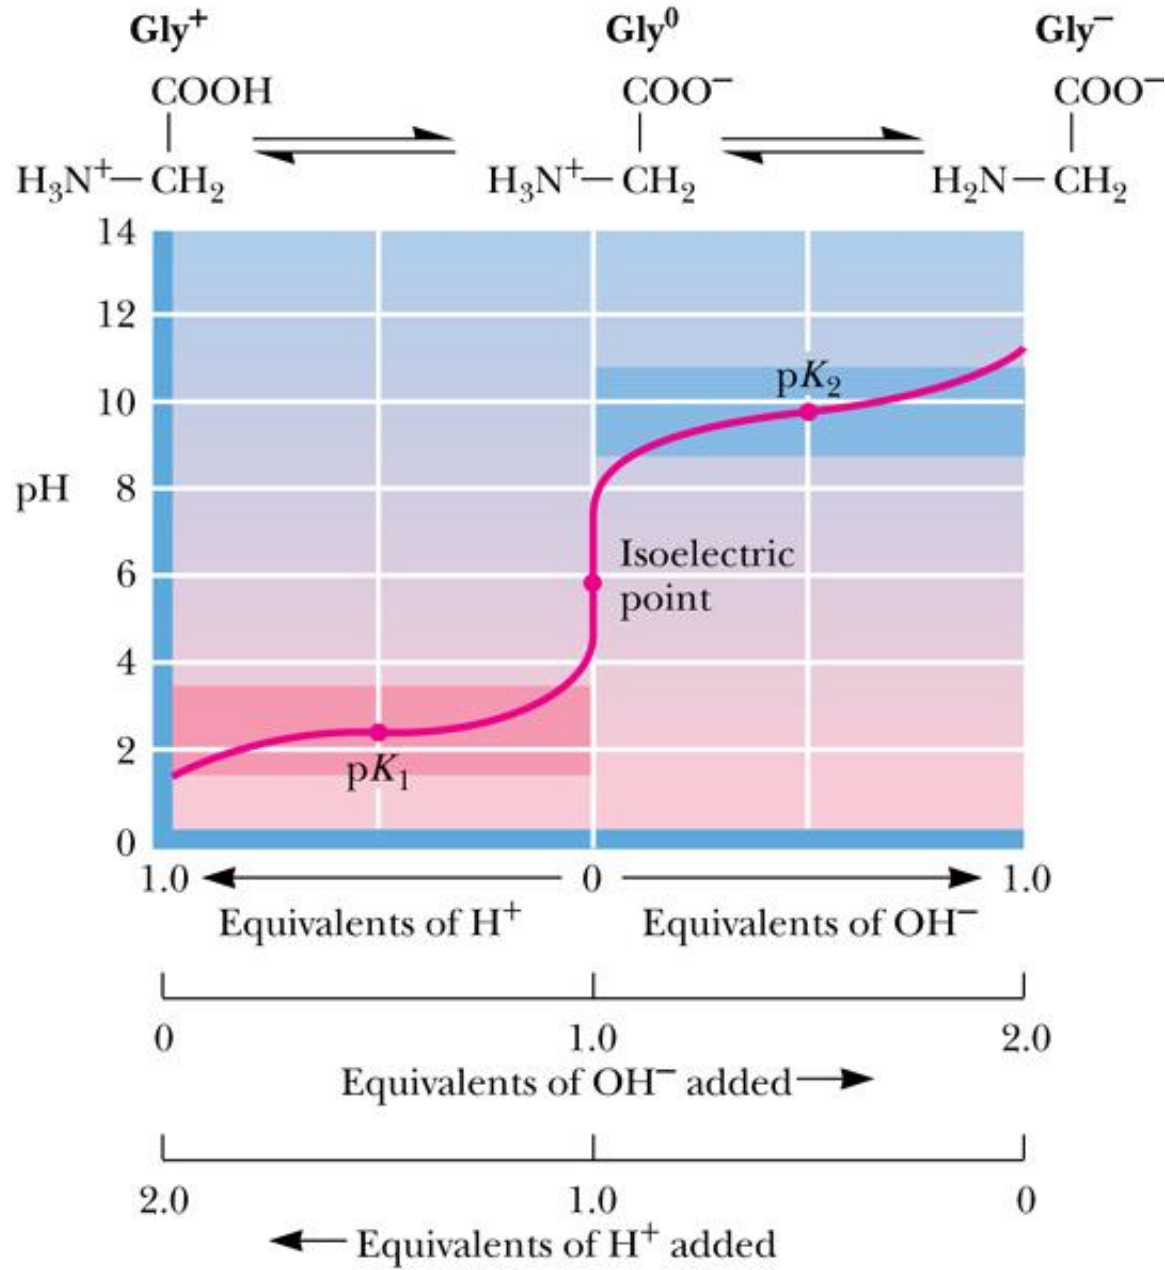

$$\text{K}_1 = \frac{[\text{H}^+][\text{AA}^0]}{[\text{AA}^+]} \Rightarrow [\text{AA}^+] = \frac{[\text{H}^+][\text{AA}^0]}{\text{K}_1}$$

$$\text{K}_2 = \frac{[\text{H}^+][\text{AA}^-]}{[\text{AA}^0]} \Rightarrow [\text{AA}^-] = \frac{\text{K}_2 \cdot [\text{AA}^0]}{[\text{H}^+]}$$

$$\because \text{pI 时, } [\text{AA}^+] = [\text{AA}^-], \therefore \frac{[\text{H}^+][\text{AA}^0]}{\text{K}_1} = \frac{\text{K}_2 \cdot [\text{AA}^0]}{[\text{H}^+]} \Rightarrow [\text{H}^+]^2 = \text{K}_1 \cdot \text{K}_2$$

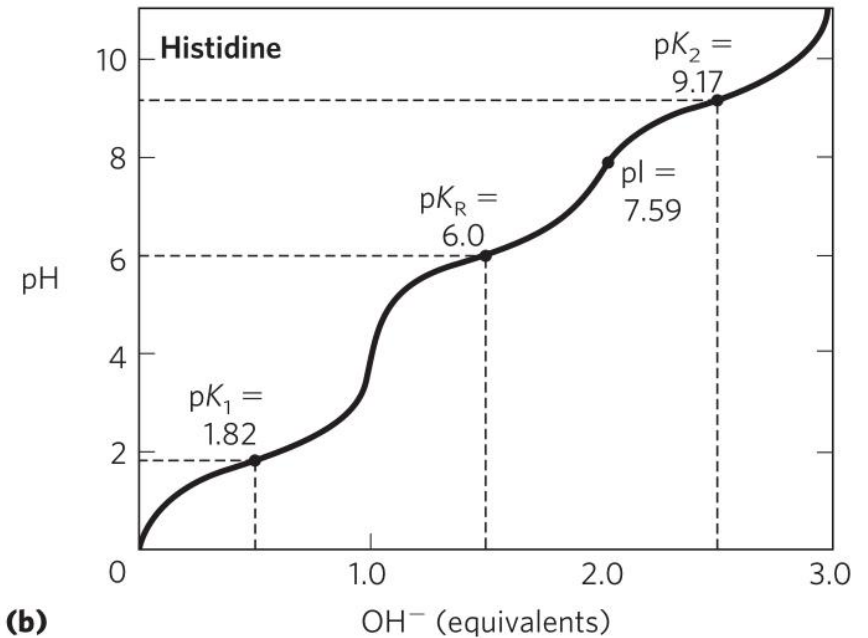

两边取负对数, 得 $\text{pH} = (\text{pK}_1 + \text{pK}_2) / 2$, 此即 pI

Titration Curve for *Glycine*

- ◆ **Amino acids with nonionizable R group (R基不电离)**
 - with similar titration curves as that of Gly
- ◆ **Amino acids with ionizable R group (R基电离)**
 - with more complex titration curves
- ◆ **Only His provides buffering power near neutral pH because of the R group ($pK_R=6.0$) (只有His在中性pH附件有缓冲作用)**

Titration Curve for *Glutamic Acid* and *Histidine*

$$pI_{\text{Glu}} = (\text{p}K_1 + \text{p}K_R) / 2$$

$$pI_{\text{His}} = (\text{p}K_R + \text{p}K_2) / 2$$

4. Spectrophotometric properties of Amino acids

Absorbance of ultraviolet light
by aromatic amino acids

| AA | λ_{\max} | $\epsilon(\text{L}\cdot\text{mol}^{-1}\cdot\text{cm}^{-1})$ |
|-----|------------------|---|
| Trp | 280nm | 5.6×10^3 |
| Tyr | 275nm | 1.4×10^3 |
| Phe | 257nm | 2.0×10^2 |

They are jointly responsible for the **light absorption** of proteins at **280nm**

- Proteins in solution absorb UV light with absorbance maximum at **280nm**
- **Measuring protein content** by photospectrometry

Absorption of light by molecules: The Lambert-Beer Law

$$A = \lg I_0/I = \lg 1/T = \epsilon cl$$

The expression $\lg(I_0/I)$ is called the absorbance, designated **A**

I_0 is the intensity of the incident light

I is the intensity of the transmitted light

I/I_0 (the inverse of the ratio in the equation) is the transmittance, **T**

ϵ is the molar extinction coefficient (in units of liters per mole-centimeter)

c is the concentration of the absorbing species (in moles per liter)

l is the path length of the light-absorbing sample (in centimeters)
